INSTRUCTIONS

This examination paper consists of two sections; **A** and **B**. It has **three** items.

Section **A** is **compulsory**.

Section **B** has two optional items. Respond to **one** item from this section.

Any additional item responded to will **not** be scored.

Begin **each** item on a **fresh** page.

All responses **must** be written on the **answer sheets** provided.

SECTION A

This section is **compulsory**.

Item 1

Nalule, the newly appointed Public Relations Officer for your school, has been tasked with creating a comprehensive digital orientation package for the incoming senior one students and their guardians. Her initial attempt was heavily criticized by the School Management Committee for being visually boring, lacking clear structure, and completely missing the school's historical photos and statistical academic performance graphs. This happened because Nalule relied entirely on a basic, offline plain-text pad and dusty, paper-bound archives. The Headteacher has now firmly demanded a professional visual slideshow for the induction ceremony, automated charts showing the school's performance trends, a shared online workspace where teachers can review and edit the content in real time, and a physical handout version for parents to take home.

To rectify this, Nalule spent hours gathering digital materials and stored them on a computer in the main office. However, when she comes in the next morning and switches on the computer's system unit, the monitor completely fails to display anything the screen remains totally black, and she cannot see her workspace. With the orientation day fast approaching, Nalule is panicking and has approached you for assistance.

Task:

- a) Assess Nalule's situation and advise her on the ICT tools required to get her orientation package approved.
- b) Analyze the computer's behavior and provide a step-by-step guide to troubleshoot the blank monitor display issue safely.

SECTION B

Answer only **one** item from this section.

Item 2

Muhindo, a passionate multimedia creator and local community educator, runs a small media center in his village. He films documentary shorts about local agriculture, records traditional folk music, and hosts evening educational workshops for the community. Currently, his operations are scattered; he stores video clips on various memory cards, manually writes down audio scripts, and struggles to share his presentations with large groups of people. Furthermore, he often misses deadlines with city-based distributors because he has to travel physically to deliver his media files.

Muhindo has decided to centralize and upgrade his media center. He needs a system setup that can:

- Capture high-quality video and high-resolution still images of community events.
- Capture clear, studio-grade vocal tracks and interviews with local elders

- Process heavy video editing tasks, render audio files, and run complex media software smoothly.
- Display educational slides and documentary films onto a large wall so that an audience of fifty villagers can watch together comfortably.
- Produce physical, hard-copy training manuals and certificates for the youths who complete his media workshops.
- Establish a reliable internet connection to upload his finished documentaries to online streaming platforms and email city distributors from his village office.
- Backup and archive terabytes of raw, historical video footage securely for long-term storage so it doesn't clutter his daily workspace or get lost during a system failure.

Muhindo has bought a brand-new desktop computer unit delivered in separate boxes, along with all the necessary peripheral devices. However, he does not know how to physically connect them or the correct order in which to safely turn everything on to avoid damaging his new equipment.

Task:

- a) Analyze Muhindo's requirements and classify the hardware tools into their correct categories, showing how each device solves a specific problem at his center.
- b) Advise Muhindo on the precise physical procedures he must follow to safely assemble his new desktop computer workspace.
- c) Outline the exact sequential power-on procedure he must implement every morning to protect his equipment from electrical damage.

Item 3

At the sub-county headquarters, the recently elected youth coordinator, Ateenyi, is facing a major crisis while preparing for an upcoming regional youth empowerment summit. Over the last three months, he has been collecting registration forms, budget spreadsheets, guest speaker profiles, and video clips of past youth projects. However, he has been saving all these files directly onto his computer's desktop without creating any folders, giving them vague names like *"Document1"*, *"New Spreadsheet"*, and *"Final Copy"*. As a result, the desktop is completely cluttered, he cannot find the official budget file requested by the auditors, and he accidentally overwrote a speaker's presentation by saving another file with the same name.

To overcome the challenges, Ateenyi intends to buy a new flash disk to transfer and organize all the summit materials. He has noted down the total number and sizes of the files currently scattering his desktop:

- 120 Word Documents: averaging 5 MB each.
- 40 Excel Spreadsheets: averaging 2,048 KB each.
- 15 High-Definition Video Clips: measuring exactly 1.2 GB each.

He needs to buy the most cost-effective storage drive that can comfortably accommodate all these files while leaving at least 2 GB of free space for final updates.

Task:

- a) Assess Ateenyi's current file storage mess and advise him on best practices for file and folder management to ensure his data is organized, easy to retrieve, and safe from accidental overwriting.
- b) Analyze the data sizes of Ateenyi's files, calculate the total storage capacity required in Gigabytes (GB), and advise him on the minimum standard flash disk size he needs to purchase. *(Show all your working).*
